PORTALDOT HACKER HOUSE 2026 · TRACK: NODE OPERATIONS AND TOOLING

NodeScope

Node truth suite for Portaldot V3

Two pillars. One evidence discipline.

HEALTH FEES

nodescope.vercel.app · github.com/Firzadf/nodescope

dorahacks.io/build/50146 · Demo video: youtu.be/14aZxVTCrz0

PROBLEM

A node can answer once. That proves almost nothing.

Health over time

An operator can see a node respond, but cannot prove it stayed healthy, or what changed since the last check.

One operation, two prices

The same operation is priced on the EVM surface and on the native surface, and headline fee numbers hide the difference.

SOLUTION

One build, two pillars, one evidence discipline.

Health

Health Score 0-100 with every point explained. Watch & Discord/Slack alerts. Reports verified by SHA-256.

Fees

One operation priced on EVM and native, side by side. Fee-only and all-in shown as they are.

Nothing polls unless you start Watch. Every score point explained. No simulated data.

DEMO FLOW · 60 SECONDS

From endpoint to verified report in five steps.

01 Open /app. The testnet endpoint is already filled in.

02 Run full diagnostic: connect, health check, capability discovery, Substrate probe, snapshot, combined verdict.

03 Read the verdict and Health Score: a stalled head reads DEGRADED even when every RPC answers, with the lost points named.

04 Compare two snapshots: new and resolved findings, block delta, latency trend.

05 Export the report and verify it at /verify. No account. No wallet.

ON-CHAIN EVIDENCE · PORTALDOT V3 TESTNET · CHAIN 420420777

Three reports anchored. Anyone can recheck them.

FEES FINDING · MEASURED 27 OCT 2026 · CONTRACT DEPLOY

The headline says 804x. The bill says 1.016x.

804x

fee-only

1.016x

all-in

EVM deploy: 124.098 tPOT · Native all-in: 122.191 tPOT · Within 2%

Most of the gap is a 122.037 tPOT storage deposit on the native side. A deposit is a hold, not a burned fee: it is refundable when storage is freed. The EVM figure already folds it in.

tPOT is a testnet token with no market price.

ENGINEERING

Built to be rechecked, not to be believed.

517 tests across 75 files	Vitest, run on every push.
5/5 Foundry contract tests	The attestation contract, tested in isolation.
CI on Ubuntu and Windows	Node on both; Foundry on Ubuntu.
CLI and GitHub Action	check and fees without the browser; a pre-deploy cost gate teams can run.
Deterministic comparison	Same inputs, same diff. Reports verified by SHA-256.
Read-only by design	No wallet, no signing. Watch runs only when you start it.

ECOSYSTEM CONTRIBUTION

Findings the ecosystem can use, not just a demo.

· Six measured findings for Portaldot, documented with reproduction steps: fee model, deposit semantics, dry-run limits, WSS connect, unavailable equivalents.

· A GitHub Action any team can run as a pre-deploy cost gate.

· An evidence standard: anchored reports anyone can recompute from the repo.

· Adoption outreach prepared. No team results claimed yet.

BUSINESS MODEL

Free to use. Paid when it runs for you.

Free, open source (MIT)

The app, Fee Lab, CLI, GitHub Action, and the attestation registry.

Paid, when there is demand

Hosted monitoring with alerts for node operators. A managed pre-deploy cost gate with history for teams and CI.

Targets: Portaldot builders, node operators, wallets and dApps that need EVM vs native routing.

Sizing, honestly: no total market claimed. Only verified counts are used.

ROADMAP · TEAM

What happens next.

Hosted 24/7 monitoring	Watch & alerts already run in the browser and CLI; hosted, when demand exists.
Pre-deploy cost gate in CI	The GitHub Action as a check teams run before deploying.
Mainnet check	The mainnet profile becomes a live check when a public mainnet EVM RPC is verified.
GitHub Action on Marketplace	Publish the action so any team can add it in one step.

Team: Firza Duta Fauzan, solo builder.
